Red Spots

REDUCE THE APPEARANCE OF RED SPOTS

WHAT TYPES OF SPOTS CAN BE REMOVED?

Broken blood vessels, spider veins, and cherry angiomas (small red bumps typically occurring on the chest and back, although they may appear elsewhere) are just some of the red spots that can be effectively treated with lasers. Red scars resulting from acne, abrasions, or surgical procedures can also be improved with lasers.

Before IPL and Vbeam Treatment

After IPL and Vbeam Treatment
WHAT TYPES OF LASERS ARE USED?
The Vbeam® Perfecta Laser, the Intense Pulsed Light, and the Gentle YAG laser can be used to treat various red spots. Multiple treatments may be necessary, although some lesions may be completely removed with just one treatment. Your physician or certified nurse practitioner may choose to use just one laser, or a combination of lasers for the most effective treatment, depending on the type of red spot.

WHO IS A GOOD CANDIDATE?
Any healthy individual with no serious medical conditions may be a good candidate.

WHAT IS THE TREATMENT LIKE?
Your skin is first numbed with a topical anesthetic to minimize any discomfort, and your eyes are protected with special goggles. The laser treatment may feel like the snap of a rubber band.

HOW MANY TREATMENTS ARE NEEDED?
The number of treatments needed depends on the condition being treated. Some spots can be completely removed with just one treatment while other lesions may require a series of treatments.

IS THERE ANY DOWNTIME?
Temporary redness and mild swelling, which usually resolves in 1 to 2 days, may occur immediately after treatment.
